Source: Company Data

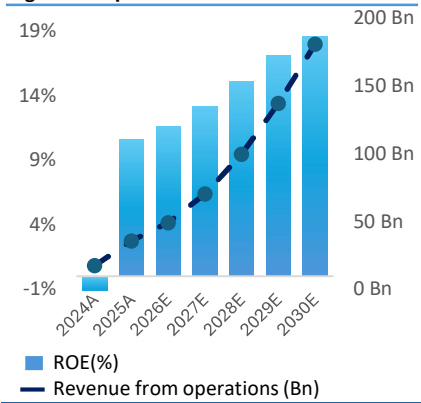
Figure 4: Explosive Revenue Growth



Inox Wind Limited (IWL) is a leading Indian wind energy solutions provider, offering turnkey services across manufacturing, EPC, and O&M. Backed by INOXGFL Group and a 3.2 GW (Figure 1) order book, it is well-positioned to benefit from India's renewable push with next-gen turbines and hybrid solutions.

INVESTMENT SUMMARY

We issue a BUY recommendation for Inox Wind Limited (INOXWIND, NSE) and a one-year target price of ₹175.69, implying an upside of 39.45% from the current price of ₹125.68 as of December 15, 2025. Our valuation is derived through a triangulated approach combining DCF (FCFF), Relative Valuation, and an Exit Multiple cross-check to ensure robustness. The investment thesis is supported by three pillars: (1) accelerating alternative-energy adoption, reshaping sector dynamics (2) a strengthening financial profile underpinned by revenue growth and margin expansion. (3) sustained policy support and technology-driven cost efficiencies. Collectively, these drivers position Inox Wind as a leading beneficiary of India's ongoing Alternative Energy transition.

THESIS 1: Alternative Energy Trends Reshape Industry Dynamics

India's renewable energy sector continues to exhibit strong structural momentum, supporting improved demand visibility for domestic wind OEMs such as Inox Wind. As per management commentary, the country's installed renewable capacity has reached 220 GW, aided by 30 GW of annual additions, while wind capacity has surpassed the 50 GW milestone, underscoring a healthy medium-term growth runway. With policy frameworks increasingly aligned toward decarbonization, hybrid projects, and investment mobilization, accelerating annual megawatt additions are expanding the addressable market across utility-scale turbines, EPC execution, and long-term O&M services. Against this backdrop, Inox Wind appears well-positioned to capitalize on the rising deployment and deepening participation in India's renewable energy transition.

THESIS 2: Strong Financial Recovery & Revenue Growth

Inox Wind is demonstrating a clear financial turnaround, reflected in sustained margin improvement and deleveraging. Gross margins expanded from 15% in FY23 to 39% in FY25, while EBITDA margins recovered to 21%, supported by operating leverage and backward integration. Return ratios have normalised, with ROCE at 14% and ROE at 10.6% in FY25 and are projected to steadily improve through FY30. At the same time, leverage continues to reduce, with Debt/Equity declining to 0.62 and interest coverage strengthening meaningfully. We believe this improves profitability, and the balance-sheet profile enhances earnings visibility and materially derisks the investment case.

THESIS 3 : Policy Support & Tech-Driven Cost Advantage

India's policy environment remains structurally supportive, with the Government targeting a sharp acceleration in wind deployment annual wind additions are planned to double to 7.1 GW over the next two years, up from 4.15 GW in FY25, driven by auctions and investment momentum. At the same time, Inox Wind is building a clear cost advantage through technology and integration: commissioning a new nacelle and hub facility near Ahmedabad, backward integrating into cranes and transformer manufacturing, and scaling its new 3 MW platform while preparing the next-generation 4.X MW turbine. These initiatives lower logistics and execution costs, shorten project timelines and enhance margins, positioning Inox Wind to benefit disproportionately as policy-led renewable expansion accelerates.

BUSINES OVERVIEW

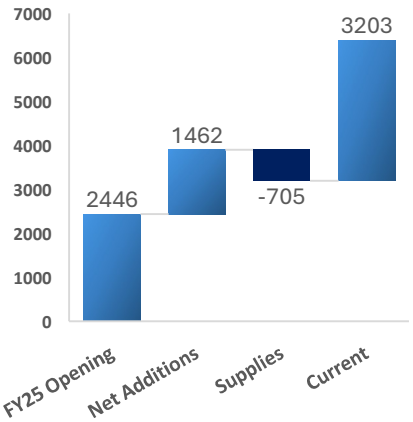
Figure 7 : Wind Capacity Movement



Source: Company Data

INTRODUCTION

Inox Wind Ltd is an Indian based diversified business group that incorporated Inox Wind Ltd in April 2009 and has interests in industrial gases, specialty chemicals, fluoropolymers, renewable energy as well as entertainment. The group has extensive history of operation in capital intensive and technology-based businesses, which offers strategic and managerial support to Inox Wind. Inox Wind is a pure play wind energy business which specializes in the production of Wind Turbine Generators (WTGs) and provision of complete wind energy. It produces key parts, including rotor blades, nacelles, hubs, and towers and distributes them to clients, such as the independent power producers (IPPs), utilities, PSUs, and corporate renewable energy purchasers. The company operates in a pan-India basis, with its operations monitored in the significant wind strong states in Gujarat, Rajasthan, Maharashtra, Tamil Nadu, and Karnataka.

BUSINESS MODEL, OPERATION & SCALE

Inox Wind adheres to vertically integrated business model which implies that it oversees the wind project lifecycle starting with manufacturing to installations and long-term maintenance. The company designs and produces WTGs on platforms consisting of 2 MW and 3.3 MW and develops 4.X MW turbines with more power to satisfy changing market demands. Together with the provision of turbines, Inox Wind also performs the role of Engineering, Procurement and Construction (EPC) of wind farms and also offers Operations and Maintenance (O&M) services; these activities produce long term revenue to the project, as long as the turbines continue to operate. This hybrid solution enables the customers to deal with one service provider, and it enhances efficiency and accountability in the execution of the same. The company has so far in FY26 completed around 202 MW of wind capacity within a quarter and has a newly acquired order of around 400 MW of new orders including a 100 MW turbine supply order with a multi-year O&M which has enhanced the revenue visibility.

CURRENT POSITION AND KEY CHALLENGES

Inox Wind is currently on the phase of recovery and fortification that is backed by the improved implementation of the projects, increased capacity utilisation and cost discipline. The revenue and net profit of the company in a recent quarter stood at around 1,160 crores and more than 120 crores respectively signifying that the company has an enhanced operating efficiency than previous years. The firm has gone beyond a stage of slowdown in the industry and stress on its balance sheet and is currently operating on a firmer order pipeline. However, the wind energy business is still capital intensive and Inox Wind still has to grapple with capital intensive issues like working capital, timelines of executing the project, domestic and international turbine makers. Infrastructure-based renewable energy firms are accustomed to these challenges, which are addressed by stricter project controls, long-term O&M contracts, and selective execution of the orders.

FUTURE OUTLOOK

The future prospects of Inox Wind are favourable as they are backed by the structural development of the renewable energy in India. By March 2025, the installed wind power generation capacity in India had reached approximately 50 GW, and the government is still encouraging wind and hybrid energy along with round-the-clock renewable energy options as a transition to clean energy. It is estimated that wind energy will be of critical application alongside the sun in the provision of electricity in future. Inox Wind can take advantage of this growth because it has an integrated business model, an order book that is running into the hundreds of MW, a focus on larger capacity turbines, and a growing proportion of long-term O&M revenues. The experience of the INOXGFL Group in the operations of large-scale industry will help the company grow its role in the ecosystem of renewable energy arrangements in India steadily and establish a more stable and long-lasting business.

RENEWABLE INDUSTRY OUTLOOK: DRIVING THE FUTURE

Global Economy: Stable Growth, Lower Inflation, Renewable Energy Upside : The global economy grew 3.3% in CY 2024, with advanced economies at 1.8% and emerging markets at 4.3%. Inflation moderated to 5.7% from 6.6%, aided by tighter policies and better energy supply. Growth is projected at 2.8% in CY 2025 and 3.0% in CY 2026, with inflation falling further. A stable macroeconomic backdrop and a push towards decarbonization create strong investment opportunities in renewables.

India's Strong Growth, Low Inflation, and Positive Outlook: India remained the fastest-growing major economy, with 6.5% GDP growth in FY 2025, driven by investments in manufacturing, services, and infrastructure. Inflation eased to 4.7%, the lowest since FY 2018–19, supported by proactive monetary measures. Robust macro stability, policy reforms, and strong FX reserves underpin a positive outlook, while clean energy transition and fiscal incentives enhance renewable investment prospects.

Renewables Accelerating Growth with Strong Policy Support: Global energy demand grew 2.2% in CY 2024, with renewables contributing 38% of supply growth, led by solar and wind. Global wind capacity reached 1,136 GW, while India's renewable capacity hit 220 GW, backed by a 500 GW non-fossil target by 2030. Policy initiatives, 100% FDI allowance, and vast resource potential position the sector for sustained growth and investment upside.

DEMAND DRIVERS

Government Policy: Strong Targets Driving Renewable Growth: India targets 500 GW non-fossil capacity by 2030, including 140 GW wind, creating a robust pipeline for turbine and EPC demand. Policy measures like ALMM mandates, hybrid tenders, offshore wind viability gap funding, and 100% FDI allowance strengthen execution and boost investor confidence.

Rising Renewable Adoption Driving Wind Demand: Global decarbonization goals and India's clean energy transition are accelerating wind project demand. Corporate PPAs and green hydrogen initiatives are emerging as key catalysts, as industries aim to meet ESG targets and reduce carbon footprints.

Economic Growth & Rising Power Demand: India's 6.5% GDP growth in FY 2025, coupled with industrial expansion and urbanization, is driving electricity consumption. This structural demand shift favors renewable energy, especially wind, due to its cost competitiveness and scalability, positioning the sector for long-term growth.

Cost Competitiveness Driving Wind Investments: Wind energy's Levelized Cost of Energy (LCOE) has declined sharply, making it competitive with fossil fuels. Continuous technological advancements and economies of scale enhance affordability, attracting strong government and private sector investments and reinforcing long-term growth prospects.

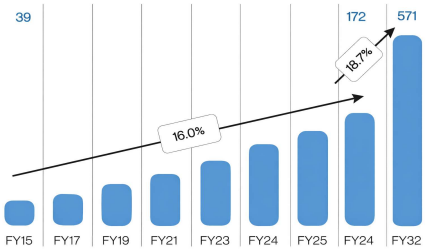
SUPPLY DRIVERS

Manufacturing Capacity & Technology Advantage: Inox Wind's capability to produce 2 MW and 3 MW turbines, along with planned capacity expansion, positions it well to meet rising demand. Technological upgrades such as larger rotor diameters and higher hub heights enhance efficiency and reduce per-unit costs, strengthening competitiveness and margins.

Infrastructure & Logistics – Key Enabler for Timely Execution: Project execution depends on land availability, transmission infrastructure, and logistics for transporting large turbine components. Government initiatives like Green Energy Corridors and improved grid connectivity enhance supply-side efficiency, reducing delays and supporting sector scalability.

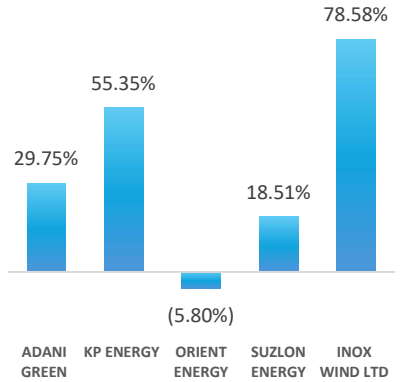
COMPETITVE POSITIONING

Figure 12 : Renewable Capacity Growth Outlook



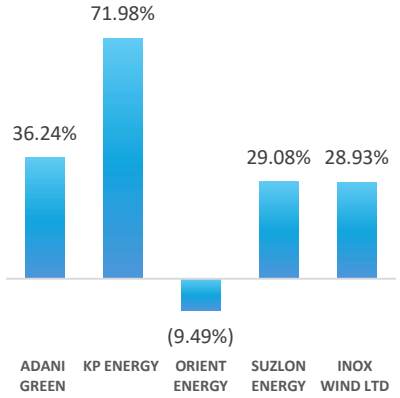
Source: Company Data

Figure 13 : Peer Comparison: Revenue CAGR



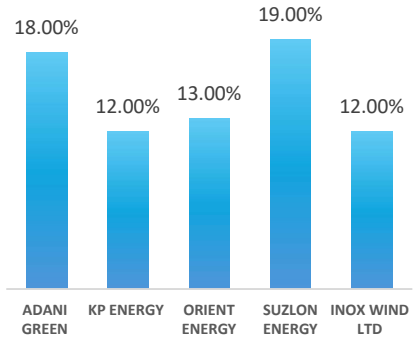
Source: Team Analysis

Figure 14 : Peer Comparison: EBITDA CAGR



Source: Team Analysis

Figure 15 : Peer Comparaison Net Profit Margines



Source: Team Analysis

Raw Material Availability & Supply Chain Stability: Availability of steel, composites, and electrical components remains critical for turbine production. Post-COVID supply chain stabilization and strategic sourcing have mitigated risks, though global geopolitical factors can still impact costs and timelines, requiring proactive management.

Financial Health & Working Capital Strength: Access to financing and debt restructuring enhances Inox Wind's ability to execute large-scale projects. Partnerships with IPPs and long-term EPC contracts ensure steady order inflow, while improved liquidity strengthens operational resilience and supports growth execution.

COMPETITIVE ANALYSIS

Positioning as India's Leading End-to-End wind solutions Provider: Inox Wind stands out by offering a vertically integrated "concept-to-commissioning" model that provides a complete, cost-effective ecosystem rather than just individual components. Unlike competitors that focus solely on power generation or specific equipment, this company controls the entire value chain—from manufacturing high-yield 3 MW and upcoming 4.X MW turbine platforms to managing site infrastructure and long-term maintenance.

Operational Efficiency and Balance Sheet Strength: Technologically, Inox Wind's edge lies in its advanced turbine design specifically optimized for low-wind regimes, allowing for higher energy yields and a lower Levelized Cost of Energy (LCOE) compared to standard industry offerings. From a financial perspective in 2025, the company has outperformed many peers by achieving a net-debt-free status, providing it with the balance sheet flexibility to execute a massive 3.2 GW order book without the liquidity constraints that often hamper other players. This combination of proprietary, high-capacity MW technology and a lean, "plug-and-play" execution model makes it a more agile and reliable partner for large-scale utility and industrial projects.

REVENUE GROWTH

Inox Wind has emerged as the sector's growth outlier, recording a revenue CAGR of 78.6% between FY22 and FY25. This trajectory significantly outpaces KP Energy's strong but lower CAGR of 55.4%, while Adani Green and Suzlon Energy delivered more moderate growth of 29.8% and 18.5% respectively. Orient Green Power, in contrast, reported a contraction of –5.8%, underscoring structural challenges in scaling its operations. The comparison highlights Inox Wind's ability to expand revenues at a pace unmatched in the industry, positioning it as the fastest scaler among listed renewable peers.

EBITDA GROWTH

Inox Wind's EBITDA CAGR of 28.9% reflects a successful turnaround from losses, its operating profitability growth remains modest relative to peers. KP Energy leads the group with an exceptional 71.9% CAGR, demonstrating rapid scaling of operating efficiency. Adani Green follows with 36.2%, while Suzlon's 29.1% is broadly in line with Inox Wind. Orient Green Power continues to underperform, with EBITDA contracting at –9.5% CAGR. This comparison suggests that although Inox Wind has stabilized its operating base, competitors such as KP Energy and Adani Green are advancing more aggressively in profitability scaling.

NET PROFIT MARGINS

Inox Wind's net profit margin of 12% places it in the mid-tier of the peer set. Suzlon Energy leads with 19%, closely followed by Adani Green at 18%, both reflecting stronger cost management and profitability at scale. Orient Green Power, despite declining revenues, maintains a margin of 13%, marginally higher than Inox. KP Energy, at 12%, is aligned with Inox Wind. The margin comparison underscores that while Inox Wind is the growth leader, it has yet to match the profitability levels of Suzlon and Adani Green, which combine steady growth with superior margin performance.

We issue a BUY recommendation on Inox Wind Limited based on a comprehensive valuation framework that integrates multiple approaches to derive a robust intrinsic value. Our target price is derived using three valuation lenses — Current Cost Valuation (CCV), DCF with terminal growth, and DCF with exit multiple validation — assigned weights of 30%, 30% and 40%, respectively. This blended methodology allows us to balance fundamental cash-flow expectations with market-based exit assum minimizing model bias and valuation concentration risk. The implied fair value from our framework results in a target price of ₹175.69, representing an upside potential of 39% from the current market price. Our estimates reflect improving execution, operating leverage, rising O&M contribution and industry tailwinds that support sustained value creation over the medium term.

VALUATION – INR 175.69, 39.45% UPSIDE

Comparable Companies Valuation (CCV)

We supplement our intrinsic valuation with a relative assessment using sector peers including Suzlon Energy, Orient Green, KP Energy and Adani Green. Applying peer medians across EV/Sales (9.05x), EV/EBITDA (19.0x), P/S (4.77x), P/E (32.48x) and P/B (5.28x) to Inox Wind's forward estimates yields an implied equity value of ₹166.29 per share, representing 32% upside versus the current market price. The analysis indicates that Inox Wind continues to trade below the peer valuation corridor despite improving profitability and balance-sheet metrics, offering scope for multiple re-rating as execution scales.

Discounted Cash Flow (DCF) Valuation

Revenue Forecasting : For the DCF, we build revenues bottom-up across three segments — Sale of Products, Sale of Services, and Other Operating Revenue. Product sales are projected using the historical 5-year CAGR of 67.6%, tapered by 10% per year to reflect normalization as scale increases. Service revenue is modeled at a steady 14% CAGR, consistent with the expanding O&M base. Other operating income is estimated using a blended approach, combining a 3-2-1 weighted average of the last three years with 50% weight to industry growth of 15.97%. This framework anchors forecasts in both company performance and sector trends while remaining conservative.

Cost Forecasting : In projecting operating costs, we focus on three key expense drivers Cost of Materials Consumed, EPC/O&M and site development expenses, and Employee benefits expense. To derive normalized cost ratios, we apply a weighted-average method that assigns greater importance to the most recent year (weight = 2) and lower importance to the preceding year (weight = 1), allowing estimates to reflect current cost behaviour while smoothing short-term volatility. This results in Cost of Materials stabilizing around 58% of revenues, EPC & O&M costs around 6–7%, and employee costs trending toward 5–6% over the forecast horizon. These assumptions anchor our margin outlook in observable operating performance rather than aggressive cost compression.

Capital Expenditure (Capex) : Our capex assumptions are driven by Inox Wind's capacity expansion and maintenance requirements, modelled through movements in gross block and accumulated depreciation. Additions to Property, Plant and Equipment are calculated as a percentage of gross block, averaging 17–25% in the near term as the company scales manufacturing and execution infrastructure, before gradually moderating over the long term. Disposals and asset rationalization are also incorporated where applicable. Depreciation is linked to gross block, trending at 5–6%, providing consistency between asset growth and expense recognition. This framework captures both growth-driven investments and ongoing asset replacement, while avoiding overly aggressive capacity build-out assumptions.

Cost of equity	17.8%	CAPM=Rf+β(Rm−Rf)
Cost of debt	8.9%	Interest expense rate
Tax rate	25.0%	Statutory tax

WACC : 17.2%

Source: Team Analysis

Terminal Value and Exit Multiple

In our DCF, Terminal Value is estimated using two complementary approaches to reduce model bias. First, we derive a terminal cash-flow stream that reflects Inox Wind's steady state profitability profile, resulting in an implied value of ₹168.71 per share under the terminal-growth framework. To cross-check this outcome, we apply an exit EV/EBITDA multiple aligned with the sector median (19x), which yields an implied value of ₹187.98 per share. Using both approaches ensures that long-term value is anchored in fundamental cash-flow compounding while remaining consistent with prevailing market pricing for renewable peers.

Beta and WACC

The Beta for Inox Wind is estimated at 1.57, calculated from historical stock returns regressed against the broader market index over a multi-year period. This approach captures the company's systematic risk relative to the market and indicates that Inox Wind exhibits higher volatility than the market, consistent with its capital-intensive and cyclical operating profile. Based on this beta, together with a risk-free rate of 6.6% and an implied market return of 13.7%, we derive a cost of equity (Ke) of 17.8%. The cost of debt (Kd) is estimated at 8.9%, reflecting current borrowing costs and tax effects. Using the company's target capital structure — 93.2% equity and 6.8% debt — we obtain a WACC of 17.2%, which we apply to discount future FCFF in our DCF framework.

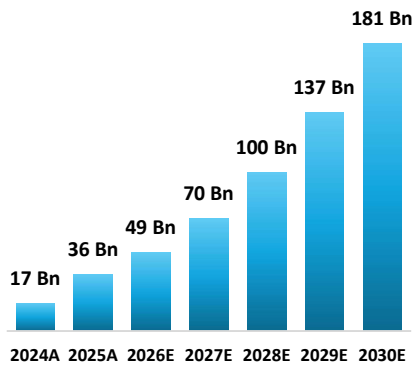
Source: Team Analysis

Figure 22 : Revenue Growth Outlook (2024–2030)

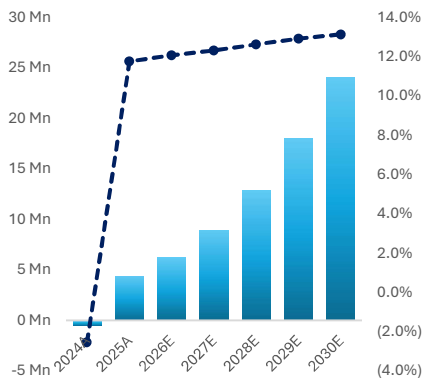


Source: Team Analysis

Revenue Analysis: Revenue from operations has accelerated meaningfully, increasing from ₹7,107 Mn in FY21 to ₹35,571 Mn in FY25, and is projected to reach ₹1,80,793 mn by FY30, translating into a CAGR of roughly ~38.5%. The growth trajectory is primarily driven by scaling turbine (product) sales, supported by improving execution and rising project volumes, with services contributing incremental stability.

Profitability Analysis : Inox Wind is transitioning from losses to sustainable profitability as operating leverage and cost efficiencies improve. EBITDA margin recovers from negative levels historically to ~21% in FY25, with stability expected around 19–21% over the forecast horizon. Net margins also strengthen meaningfully, improving from losses in prior years to 12–13% by FY28–30, supported by lower finance costs, better pricing discipline and an increasing share of high-margin O&M services.

Figure 23 : Profit and Net Margin Outlook (2024–2030)



Source: Team Analysis

Liquidity Analysis: The company's liquidity position has improved materially, reflected in an increase in the current ratio from ~1.1 in FY21 to ~2.9 in FY25, indicating stronger short-term coverage of liabilities. Quick ratio trends also suggest healthier working-capital management, as receivable and inventory cycles normalize with scale. Overall, Inox Wind appears better positioned to manage operating needs without liquidity stress.

Solvency Analysis: Capital structure has strengthened meaningfully. Debt/Equity declines from ~1.98x in FY21 to ~0.62x in FY25, with a further decline expected over the forecast period as internal accruals improve. Interest coverage improves sharply from negative levels to ~4.3x in FY25 and is projected to rise gradually as profitability scales. This gradual deleveraging reduces financial risk and supports valuation re-rating.

Capital Efficiency: Returns are improving from a low base. ROCE increases to ~14% in FY25 and is projected to move towards ~19–20% by FY30, while ROE rises from ~11% in FY25 toward ~18–19% over the same period. These improved return metrics reflect better asset utilization, margin improvement and declining leverage, signaling that future growth is increasingly value-accretive.

INVESTMENT RISK

Risk	Mitigant Strategies
MR1	Diversify revenue streams by expanding into private PPAs, captive projects, and exports.
MR 2	Invest in cost-efficient turbine platforms, backward integration, and digital O&M tools.
MR 3	Develop strategic partnerships to offer hybrid wind-solar-storage solutions.
OR 1	Coordinate early with transmission agencies; prioritize projects with ready infrastructure.
OR 2	Expand vendor base, localize sourcing, and build buffer inventory for critical components.
OR 3	Engage early with local authorities; use group synergies for land banking and clearances.
BR 1	Strengthen receivable manage -ment, negotiate milestone-based payments with clients.
BR 2	Maintain conservative capital structure; diversify funding sources and refinance smartly.
BR 3	Broaden customer base across IPPs, utilities, and industrial clients; reduce group reliance.

MARKET RISK

MR1: Demand Cyclicality in Renewable Auctions:
Inox Wind's growth is closely tied to government-led renewable energy auctions. Any slowdown in auction activity or delays in tender announcements can create demand cyclicality, leaving the company exposed to periods of weak order inflows. This reliance on policy-driven demand makes revenue visibility uncertain and can lead to volatility in financial performance.

MR2: Competitive Pricing Pressure:
The wind turbine industry in India is highly competitive, with domestic players like Suzlon and KP Energy and global OEMs offering aggressive pricing. This compresses margins and challenges Inox Wind's ability to sustain profitability. Price wars often erode differentiation based on technology or service quality, forcing companies to compete primarily on cost.

MR3: Hybrid Energy Integration:
The growing preference for hybrid renewable projects (wind-solar-storage) poses a strategic risk for pure-play wind companies. Investors and utilities increasingly Favour hybrid solutions for their ability to deliver stable generation profiles. Without adapting its portfolio to integrate solar and storage, Inox Wind risks losing market share as capital flows shift toward hybrid projects.

OPERATIONAL RISK

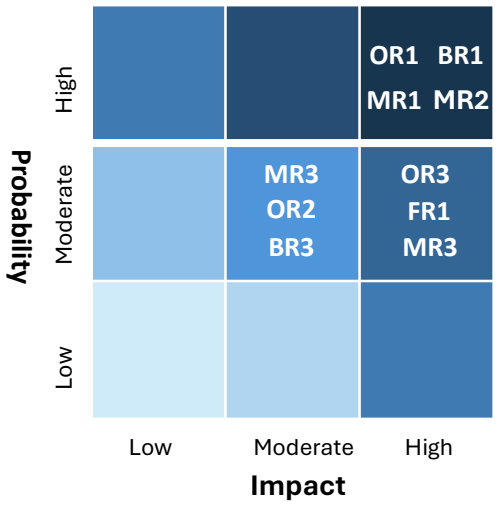
OR1: Grid Connectivity Bottlenecks
Execution of wind projects depends heavily on transmission infrastructure readiness. Delays in grid connectivity or inadequate evacuation capacity can stall commissioning, leading to deferred revenues and client dissatisfaction. This risk is particularly acute in states where transmission projects lag behind renewable capacity additions.

OR2: Supply Chain Concentration
Critical turbine components such as blades, nacelles, and towers rely on a limited supplier base. Any disruption in logistics, vendor delays, or geopolitical events can impact production schedules and inflate costs. Inox Wind has invested in backward integration and localized sourcing to reduce dependency, but supplier concentration continues to pose operational risk.

OR3: Land Acquisition Challenges
Wind projects require large tracts of land in high-wind corridors. Delays in land acquisition, regulatory clearances, or local opposition can stall execution, increasing working capital intensity and project risk. Inox Wind mitigates this by leveraging group synergies and engaging with local stakeholders early, but land readiness remains a recurring challenge in project timelines.

FR 1 The Company mitigates financial risk through tighter cash management, prudent borrowing, and selective hedging.

Figure 24 :Risk matrix



BUSINESS RISK

BR1: Working Capital Intensity

Inox Wind's EPC-driven model requires significant upfront investment in inventory and project execution. Delays in client payments, especially from state utilities, can strain liquidity and increase reliance on short-term borrowings. Efficient receivables management and tighter contract terms are critical to mitigating this risk.

BR2: Debt and Leverage Exposure

Although Inox Wind has reduced debt in recent years, leverage remains a concern. Margin compression or execution delays could affect debt servicing capacity, particularly in a rising interest rate environment. Maintaining prudent capital structure and refinancing flexibility is essential to safeguard financial stability.

BR3: Client Concentration Risk

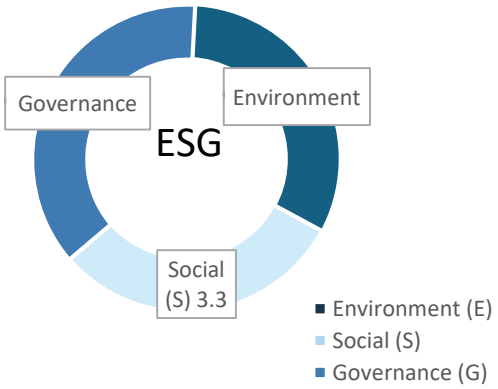
A large portion of Inox Wind's revenues comes from a few major clients and group entities. Overdependence increases vulnerability to cancellations, renegotiations, or delays, impacting revenue stability and long-term growth prospects. Diversification of the client base and expansion into private PPAs are key strategies to reduce concentration risk.

FINANCIAL RISK

FR1: Inox Wind faces financial risk from high borrowings, elevated interest costs and heavy reliance on short-term working-capital funding. Liquidity remains sensitive to delays in receivables, project execution and refinancing conditions, while FX and interest-rate volatility can further pressure margins.

ESG

Figure 25 : ESG matrix



Environment : The company demonstrates improving environmental efficiency, with strong reductions in GHG intensity and better energy intensity performance. However, rising absolute emissions, higher waste generation and declining water-recycling levels highlight areas requiring stronger operational controls and long-term sustainability initiatives.

Social : The company maintains a strong safety record with zero LTIs and rising employee benefits, indicating commitment to worker well-being. However, limited hiring momentum, restructuring in workforce composition and weak diversity disclosure suggest scope for improvement in inclusion and long-term workforce development

Governance: Governance practices are robust, supported by an independent Board, strong policies, transparent disclosures and structured ESG oversight. Continued progress on quantifying ESG risk integration and linking executive accountability to measurable ESG outcomes would further strengthen governance maturity.

ICR - Interest Coverage Ratio
BU - Billion Units (electricity)
CAPM - Capital Asset Pricing Model

1. BOARD OF DIRECTORS

Devansh Jain
Whole-time Director

Manoj Dixit
Whole-time Director

Sanjeev Jain
Independent Director

Brij Mohan Bansal
Independent Director

Kailash Lal Tarachandani
Group Chief Executive Officer
Renewable Business

Mukesh Manglik
Non-Executive Director

Sanjeev Agarwal
Chief Executive Officer

Shivam Tandon
Chief Financial Officer

NAME AND POSITION	APPOINTMNET	EDUCATION	WORK EXPERIENCE
Devansh Jain Whole-time Director	**April 25, 2009**	double major in economics and business administration.	over 10 years of work experience in various management positions
Manoj Dixit Whole-time Director	**December 3, 2022**	Master's Degree in Mechanical Engineering	26+ years of experience in power management, and regulatory & policy matters
Mukesh Manglik Non-Executive Director		Bachelor's Degree in Electrical Engineering.	4 decades of expertise in power electronics with 22+ years in the wind sector.
Sanjeev Jain Independent Director	**April 26, 2024.**	Chartered Accountant and Commerce Graduate.	2+ decades of experience as a practicing Chartered Accountant
Brij Mohan Bansal Independent Director	**1st April 2024.**	B. Tech in Chemical Engineering and PG Diploma in Process Plant Engineering,	4+ decades of experience across business development, R&D, refinery operations and various project execution.
Kailash Lal Tarachandani Group Chief Executive Officer Renewable Business	**July 29, 2014**	Bachelor's Degree of Technology in Electrical Engineering and a Master's Degree in Business Administration.	29+ years of experience in strategy management, global project execution, product and business development etc.
Sanjeev Agarwal Chief Executive Officer	**January 1, 2025**	Masters of Management Science, Marketing	33+ years of experience in execution, sales, and strategic supply chain, driving safety etc.
Shivam Tandon Chief Financial Officer	**February 1, 2025**	Chartered Accountant	16+ years of experience across manufacturing industries, specializing in financial reporting, budgeting etc.
